

Dimock Preliminary Data Review Process

1. Ft. Meade OASQA Laboratory Branch send out an email to Rich Fetzer, Rich Rupert, Jerry Heston and Dennis Carney with preliminary results listed for the 13 analytes specified. That email is usually received late in the day. This is not final data and subject to additional analysis and/or review and data validation.
2. The OSC reviews each day's prelim update to consider the results above the established screening levels. Generally the OSC is looking for very high concentrations which would give some immediate health concern to the resident using the water.
3. At 0800 the OSC and his manager have a conference call to discuss the latest results and whether any issues need to be raised for the 0830 meeting with upper management.
4. Should any concentrations result in the OSC making recommendations to take an action, the process which Dennis drafted.
5. The OSC will continue to follow up on various data issues which arise on this process until the situation is resolved or final data is available.
